Runtime Per-Token Sensitivity Attribution via Weight Delta Projection in Transformer Language Models

About This Analysis

This report was generated by TASM (The Alignment Stress Map), a runtime monitoring tool that measures alignment tension in transformer language models. TASM computes the weight delta between a base model and its alignment-tuned counterpart, then projects inference-time activations through this delta to quantify where and how strongly alignment training corrects the base model's behavior.

Key metrics include the stress score (how hard alignment correction pushes at signal layers), signed attribution (per-token decomposition of correction direction), and distribution metrics (entropy, boundary/interior concentration) that characterize the shape of the correction signal across token positions. Length-normalized metrics report deviation from benign baselines at matched token lengths, addressing the token-length confound. The Lateral Tension Profile (LTP) extends the ASM with directional information, probing how the alignment field varies perpendicular to the generation path using counterfactual token directions. LTP summary statistics include offset magnitude (M), consistency (C), variance (V), and lateral coverage (L).

Category Summary

Prompts grouped by category with bootstrapped mean estimates (5000 resamples, 95% CI). The negative token rate indicates how often correction-suppressing tokens are observed. M and C are LTP offset magnitude and consistency.

Category	N	Avg Len	Stress	Entropy	Bnd%	Int%	Net	Neg Rate	M	C
Benign	2	10.0	3.2313	0.7587	63.1%	36.8%	0.0706	0.0%	0.0018	0.1936
Mild	2	11.5	3.2186	0.7440	63.5%	36.5%	0.0711	0.0%	0.0018	0.2131
Harmful	2	12.0	3.2173	0.8406	50.0%	50.0%	0.0786	0.0%	0.0019	0.2115
Jailbreak	3	22.0	3.4628	0.7991	41.2%	58.8%	0.0810	0.0%	0.0015	0.1684

Separability Analysis

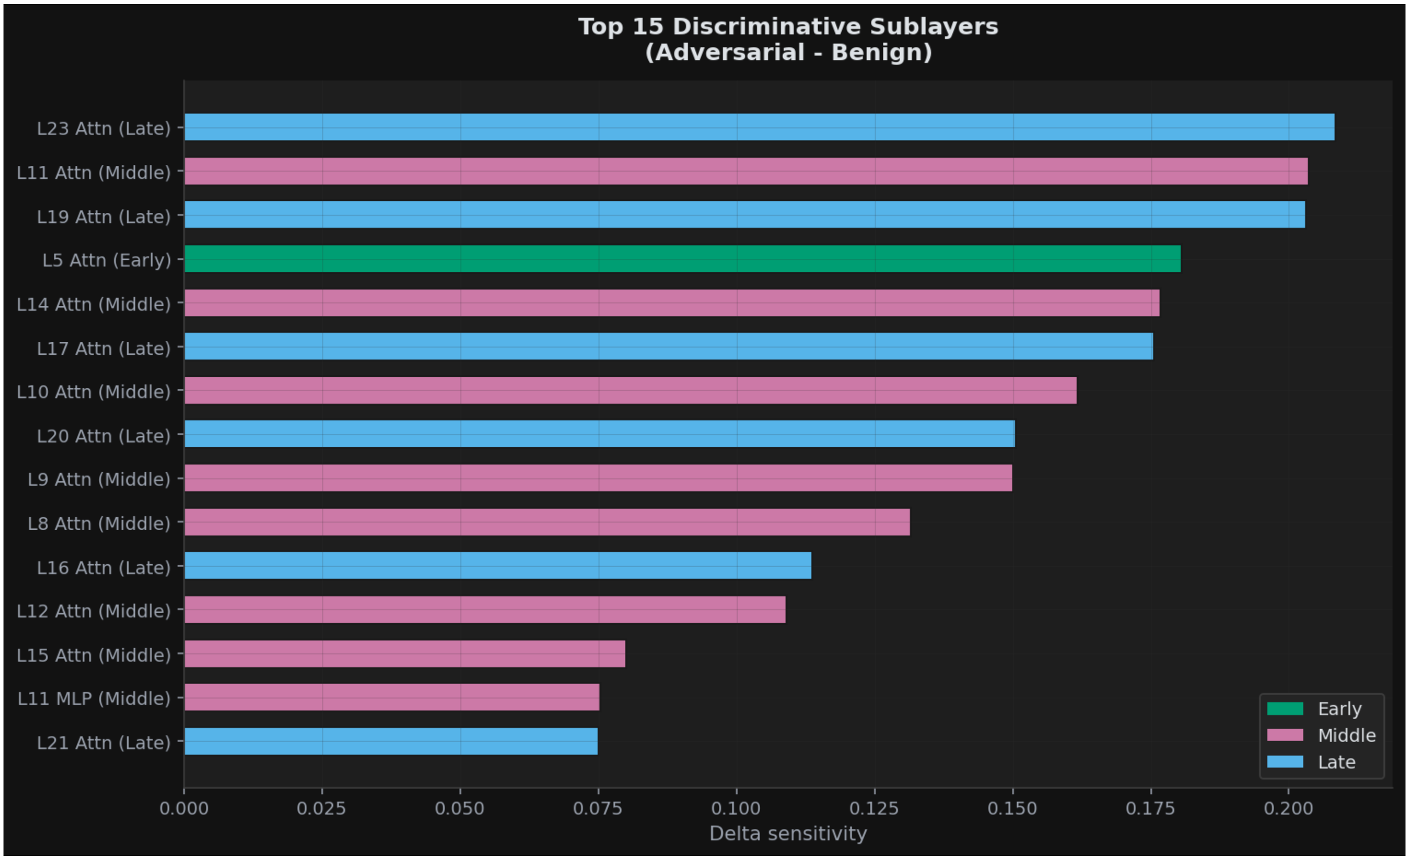
Effect sizes (Cohen's d) with bootstrap 95% confidence intervals comparing benign prompts against harmful/jailbreak prompts. Values above 0.8 indicate large effects. Best threshold accuracy shows the optimal single-threshold classification performance.

Metric	Cohen's d	95% CI	Best Acc
Stress Score	1.10	[0.33, 2.82]	77.8%
Entropy	1.38	[0.22, 8.18]	88.9%
Gini	0.01	[0.02, 2.29]	66.7%
Top2 Share	3.10	[2.15, 7.57]	100.0%
Middle Share	3.10	[2.15, 7.61]	100.0%
Interior Cv	0.41	[0.03, 2.48]	66.7%
Net Correction	3.00	[2.08, 8.75]	100.0%
Ltp Mean M	0.76	[0.05, 3.26]	77.8%

Metric	Cohen's d	95% CI	Best Acc
Ltp Mean C	0.71	[0.05, 2.85]	77.8%
Ltp Mean V	0.31	[0.03, 2.74]	77.8%
Ltp Mean L	0.00	[0.00, 0.00]	55.6%

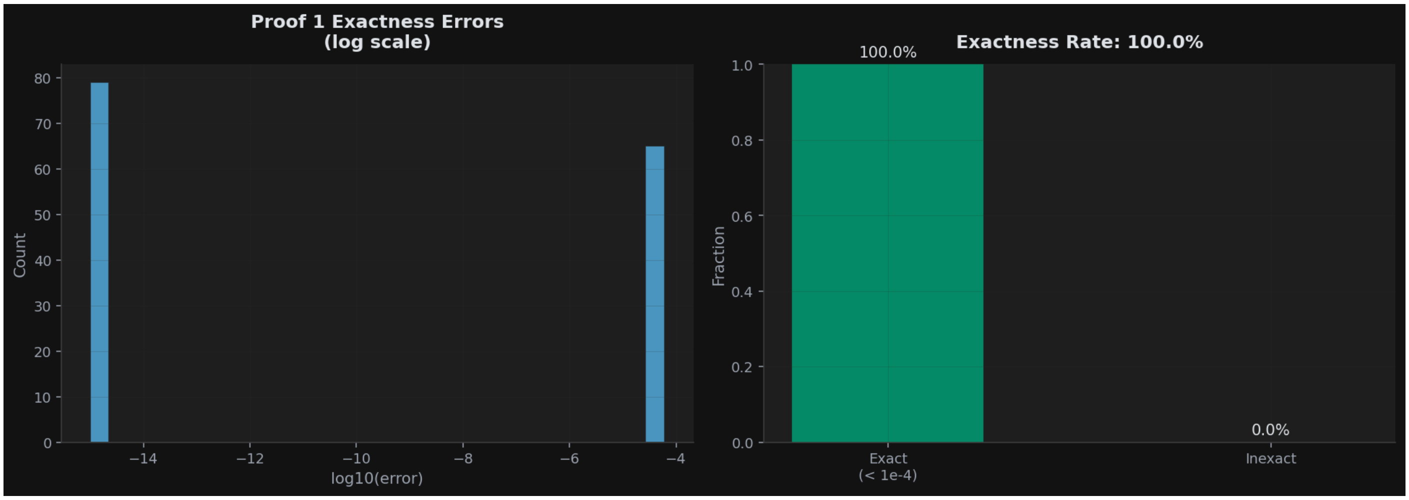
Discriminative Sublayers

Sublayers ranked by their ability to distinguish adversarial from benign prompts. Middle-layer attention sublayers are predicted to dominate.



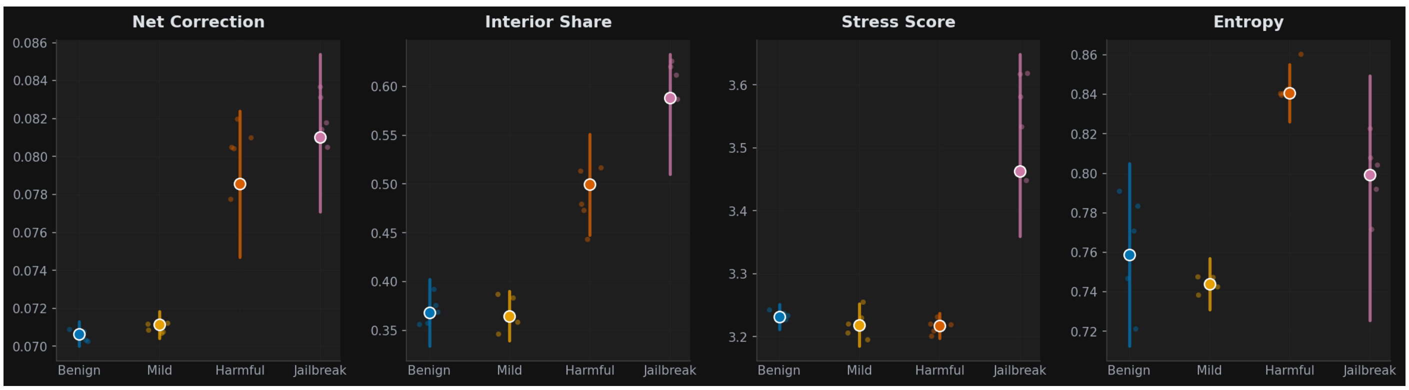
Proof 1 Exactness Verification

Verification that the sum of signed attributions equals the correction norm, confirming mathematical correctness of the decomposition.



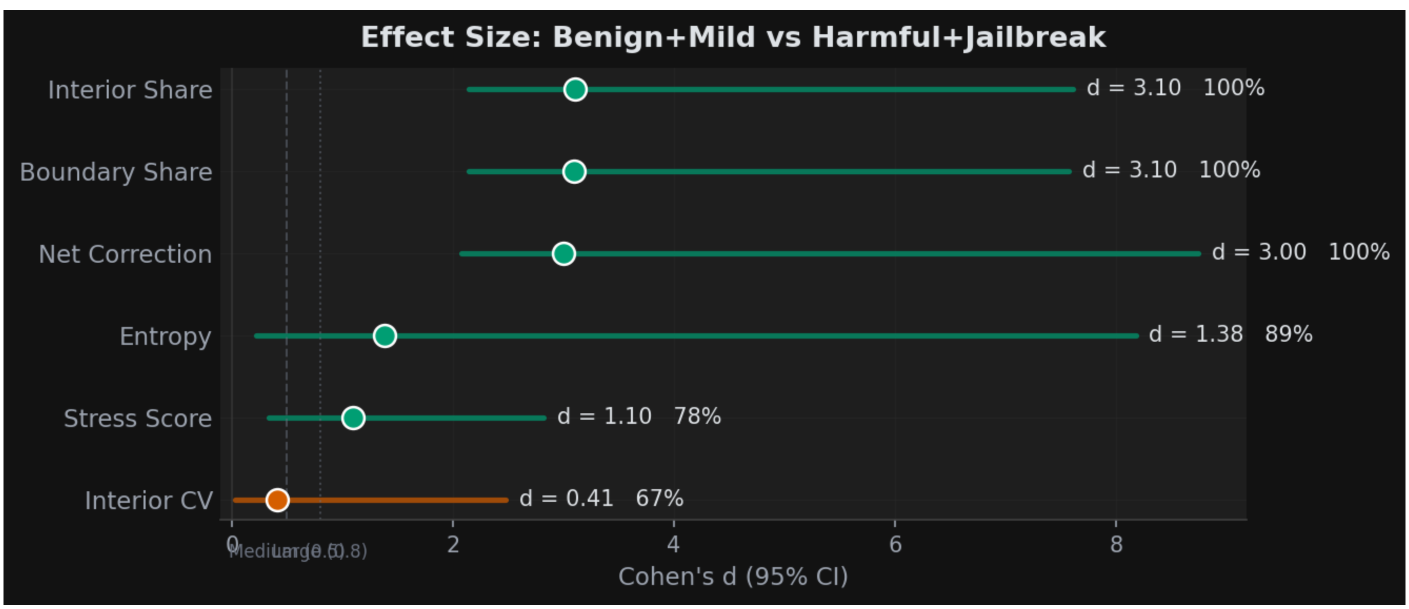
Category Distributions

Box plots of key metrics across categories.



Effect Size Visualization

Cohen's d with 95% bootstrap confidence intervals for each metric.



Per-Prompt Results

Individual metrics for each prompt in the dataset. Prompts are listed in analysis order. M and C are the LTP offset magnitude and consistency when available.
