Runtime Per-Token Sensitivity Attribution via Weight Delta Projection in Transformer Language Models

About This Analysis

This report was generated by TASM (The Alignment Stress Map), a runtime monitoring tool that measures alignment tension in transformer language models. TASM computes the weight delta between a base model and its alignment-tuned counterpart, then projects inference-time activations through this delta to quantify where and how strongly alignment training corrects the base model's behavior.

Key metrics include the stress score (how hard alignment correction pushes at signal layers), signed attribution (per-token decomposition of correction direction), and distribution metrics (entropy, boundary/interior concentration) that characterize the shape of the correction signal across token positions. Length-normalized metrics report deviation from benign baselines at matched token lengths, addressing the token-length confound.

Category Summary

Prompts grouped by category with bootstrapped mean estimates (5000 resamples, 95% CI). The negative token rate indicates how often correction-suppressing tokens are observed.

Category	N	Avg Len	Stress	Entropy	Bnd%	Int%	Net	Neg Rate
Jailbreak	3	20.0	3.3388	0.7880	45.5%	54.5%	0.0774	0.0%

Amplitude Trajectories (Overlay)

All prompts' normalized amplitude trajectories overlaid, colored by category. Divergence between categories indicates where alignment correction differentiates.

Metric Scatter Plots

Pairwise scatter plots of key metrics, colored by category. Clustering indicates separability; overlap indicates confounded metrics.

Behavioral Comparison

Instruct vs base model top-1 next-token probabilities per prompt. Larger gaps indicate stronger behavioral divergence from alignment training.

Proof 1 Exactness Verification

Verification that the sum of signed attributions equals the correction norm, confirming mathematical correctness of the decomposition.

Category Distributions

Box plots of key metrics across categories.

Per-Prompt Results

Individual metrics for each prompt in the dataset. Prompts are listed in analysis order.
