Runtime Per-Token Sensitivity Attribution via Weight Delta Projection in Transformer Language Models

About This Analysis

This report was generated by TASM (The Alignment Stress Map), a runtime monitoring tool that measures alignment tension in transformer language models. TASM computes the weight delta between a base model and its alignment-tuned counterpart, then projects inference-time activations through this delta to quantify where and how strongly alignment training corrects the base model's behavior.

Key metrics include the stress score (how hard alignment correction pushes at signal layers), signed attribution (per-token decomposition of correction direction), and distribution metrics (entropy, boundary/interior concentration) that characterize the shape of the correction signal across token positions. Length-normalized metrics report deviation from benign baselines at matched token lengths, addressing the token-length confound. The Lateral Tension Profile (LTP) extends the ASM with directional information, probing how the alignment field varies perpendicular to the generation path using counterfactual token directions. LTP summary statistics include offset magnitude (M), consistency (C), variance (V), and lateral coverage (L).

Category Summary

Prompts grouped by category with bootstrapped mean estimates (5000 resamples, 95% CI). The negative token rate indicates how often correction-suppressing tokens are observed. M and C are LTP offset magnitude and consistency.

Category	N	Avg Len	Stress	Entropy	Bnd%	Int%	Net	Neg Rate	M	C
Benign	13	16.6	3.2213	0.7869	57.1%	42.9%	0.0716	0.0%	0.0012	0.2001
Mild	13	17.8	3.2431	0.7565	59.9%	40.1%	0.0707	0.0%	0.0011	0.1969
Harmful	13	15.8	3.2640	0.8185	51.1%	48.9%	0.0772	0.0%	0.0012	0.2113
Jailbreak	13	19.3	3.4318	0.8252	41.5%	58.5%	0.0820	0.0%	0.0013	0.2145

Separability Analysis

Effect sizes (Cohen's d) with bootstrap 95% confidence intervals comparing benign prompts against harmful/jailbreak prompts. Values above 0.8 indicate large effects. Best threshold accuracy shows the optimal single-threshold classification performance.

Metric	Cohen's d	95% CI	Best Acc
Stress Score	0.88	[0.40, 1.39]	65.4%
Entropy	1.02	[0.50, 1.59]	75.0%
Gini	0.22	[0.01, 0.81]	61.5%
Top2 Share	1.43	[0.85, 2.25]	80.8%
Middle Share	1.43	[0.85, 2.24]	80.8%
Interior Cv	0.65	[0.15, 1.21]	63.5%
Net Correction	1.87	[1.35, 2.65]	86.5%
Ltp Mean M	0.30	[0.02, 0.91]	65.4%

Metric	Cohen's d	95% CI	Best Acc
Ltp Mean C	0.23	[0.01, 0.84]	65.4%
Ltp Mean V	0.04	[0.01, 0.65]	55.8%
Ltp Mean L	0.00	[0.00, 0.00]	50.0%

Metric Scatter Plots

Pairwise scatter plots of key metrics, colored by category. Clustering indicates separability; overlap indicates confounded metrics.

Behavioral Comparison

Instruct vs base model top-1 next-token probabilities per prompt. Larger gaps indicate stronger behavioral divergence from alignment training.

Proof 1 Exactness Verification

Verification that the sum of signed attributions equals the correction norm, confirming mathematical correctness of the decomposition.

Category Distributions

Box plots of key metrics across categories.

Effect Size Visualization

Cohen's d with 95% bootstrap confidence intervals for each metric.

LTP Summary by Category

Box plots of the four LTP summary statistics (M, C, V, L) across prompt categories. Hypothesis 1 predicts adversarial prompts show higher offset magnitude.

LTP Offset Magnitude vs Stress Score

Scatter plot of LTP offset magnitude (M) against ASM stress score. Prompts that are separable by M but not by stress validate Hypothesis 3 (lateral structure captures information that amplitude alone does not).

Profile Shape Distribution

Distribution of steep, flat, and inverted lateral tension profiles by category. Hypothesis 5 predicts that shape distributions differ between categories.

Per-Prompt Results

Individual metrics for each prompt in the dataset. Prompts are listed in analysis order. M and C are the LTP offset magnitude and consistency when available.
